

ABSTRACT OF THE DISCLOSURE

Image-capturing signal lines through which
image-capturing signals are output from an image-capturing
element include separate lines, i.e., an image-capturing
5 signal line corresponding to G color and an image-capturing
signal line corresponding to R color and B color. The level
of the G color image-capturing signal is adjusted at a first
gain circuit, whereas the levels of the image-capturing signals
corresponding to R color and B color are adjusted at a second
10 gain circuit.
